

Make the agent act: excessive agency & memory poisoning

The delete command was in the data, and the agent ran it

The memory is a shared tenant scratchpad, not your conversation

Two tools, one request: the secrets walk out, and the memory only signs the receipt

The attack is JSON on an ordinary POST, and the app grades itself

demo/redvault_client.py · POST /chat, /reset, /healthz · stdlib only

Ticket #4471: three words for the machine, one line of theatre for us

Three POSTs, two names, and a verdict that needs one "no"

One button, one line: did the client get what they asked for?
